### CASED AND INSULATED PIPELINE INSPECTION WITH THE EMW-C

The EMW-C Inspection System provides pipeline operators with the ability to gain valuable information about the condition and environment of cased and insulated pipelines that is not otherwise available without removal of the casing or delagging. Using the EMW-C, long lengths of pipe can be inspected to identify locations of corrosion product, water buildup, carrier sag, and electrolytic or metallic shorts. This long range tool considerably minimizes inspection times where similar tools may only provide for short range inspection in the immediate vicinity of the tool.
